InspectPro

Company Edition changelog

V5 · Build 16

Development history · Builds 1-16

Newest changes first. Entries describe the work recorded for each build; an intermediate build without retained notes is identified explicitly.

Build 16 / Clearer company sharing and workspace settings

- Added a step-by-step manager guide for creating the company Drive workspace, inviting engineers, first connection, checking two-way sync and removing access. Engineers use their own Google accounts.

- Moved Timesheets and Paid and unpaid leave into Settings. Clock in and Clock out remain on Home, with existing records and contract permissions retained.

- Browsers and phone shortcuts can retain an encrypted Google renewal credential after consent, so company Drive and personal backups reconnect after reopening. Each account remains separate, and Settings can forget the saved browser connection. Google may still require consent after revocation or expiry.

- Password Vault and Guides now verify every protected copy against an independent admin approval. Engineers cannot replace PINs through shared Drive edits, forged owner records or old backups. Existing sections require the manager to unlock, review and approve them once. An internet connection is required for verification; older apps must update after protection is enabled.

Build 15 / Automatic company sharing and Drive reconnection

- The app now identifies this release as V5 · Build 15 · Release 4, with the development-build history available from Changelog.

- Home Sync company records and Refresh status now show progress and results underneath each button label. Sync opens Drive connection settings when needed; Refresh checks the connected company Drive and refreshes dashboard counts without uploading records.

- Existing company details and logo in company Drive replace newly created local profiles and automatically resolve profile conflicts. The discarded local details remain in device backup data. Managers can still update company details after syncing; job conflicts keep their existing review process.

- Added a Search country button to company setup and company details. Find countries by name or code; search selections are retained while editing and saved with the company profile.

- Language choices now show only the selected country's supported languages. Ireland offers English and Gaeilge; switching country refreshes the list and corrects an unrelated saved language.

- Agreed contract amounts and subscription prices are unchanged. Updates retain existing records and account workspaces.

- Country is now the single regional control: select the country, then one of its supported languages. Display currency follows the country automatically.

- Invitations can be pasted before Google sign-in. Existing members and practice-company owners can join another company and switch between authorised memberships in Settings; each workspace keeps separate records.

- Android restores remembered company Drive and personal backup connections without repeating account selection where Google permission remains valid. Browsers remember the account and shared file, with a Continue action when Google requires renewed permission.

- Non-working dates use a calendar with optional date ranges and removal. Settings explain company details, connections, contract terms and overtime.

- Contract currency follows its country. Separate currency-search and conversion buttons have been removed; existing agreed amounts are converted only when changing contract country with a verified rate and saving.

- Switching company clears unsaved contract and leave fields before loading the selected company; saved terms remain in their original workspace.

- Company invitations automatically prepare Drive access for the invited Google account. The manager app also repairs missing access for existing engineers and removes access for expired unused invitations or removed members while connected.

- Engineers reconnect to the manager’s existing company file on Android reopening using their own Google account; shared company details load automatically. Google may require a first consent/file-selection step.

- Personal Drive backups reuse the same account’s current permission and restore on Android, including older connections without a completed backup. Browser permission renewal remains a user action.

Build 14 / Language and country preferences

- Choosing a language selects a matching default country and currency; users can choose a different country.

- Countries with several supported national languages offer a choice of language. Regional selections are remembered.

- Improved translated labels and search controls for regional preferences.

Build 13 / Daily work, inspections and a clearer interface

- Company setup is hidden after creation, with clearer manager and invited-engineer entry. Remembered sign-in and Back-to-Home navigation preserve the company connection.

- Password Vault and Guides support encrypted local access and separate manager-controlled PINs. Managers and engineers can clock in and out.

- Managers can configure contract pay, overtime periods and rates, and paid or unpaid leave. Currency conversion is for display and does not rewrite agreed contract rates.

- Added searchable language and country choices, translated interface packs and a compact header. Drive and backup controls are grouped in Settings; routine automatic sync is quieter.

- Improved cloud status and At a glance refresh. Fire inspections distinguish general alarms from suppression systems, include conventional/addressable type and brand, and offer generic assessment checklists. Dry/wet testing applies only to suppression.

- Improved browser updates and Google Play update access. Support contact updated to alex.aialarms@outlook.ie.

Build 12 / Self-service closed beta

- Volunteers can join the tester group and sign in without individual email approval.

- Eligible company owners receive a time-limited, no-card beta workspace. Purchase controls are hidden while beta or review access is active.

- Added clearer joining, access-expiry and privacy information for Android and PC. Released to the closed-test group after Google approval.

Build 11 / Intermediate development revision

- No separate feature notes were retained for this intermediate revision. The completed self-service beta changes are recorded under Build 12.

Build 10 / Reliable forms and closed-test preparation

- Fixed embedded service forms so reports open, save and reopen with their entered details on PC and Android.

- Replaced inherited site-specific templates and labels with generic company inspection defaults.

- Prepared the closed-test release, store information, reviewer access and privacy declarations.

Build 9 / Engineer Drive access and purchase recovery

- Engineers choose their own Google account when connecting to the owner-shared company workspace. A mismatched account is rejected before file selection.

- Corrected the browser file chooser configuration and refreshed cached app files so the shared workspace can be selected.

- Confirmed sample records shared in both directions. Corrected subscription verification so a completed test purchase and Restore purchase unlock company access.

Build 8 / Review access and clearer sync feedback

- Added an isolated review workspace with access that does not require a purchase.

- Company sync reports its account, device record count and pending changes in a visible status message.

- Improved owner/engineer record-sharing checks and diagnostics during the two-device beta setup.

Build 7 / Company sharing and subscription testing

- Added a shared company workspace in the owner's Google Drive, with member invitations, explicit Drive sharing and access-removal controls.

- Added record and company-branding sync, offline change handling and conflict retention. Videos are not included in shared-record sync.

- Connected monthly and annual subscription choices and eligible seven-day trial offers to Google Play testing. Fixed the subscription-price loading callback.

- Added shared-file selection on Android and PC and prepared sign-in for Play-distributed builds.

Build 6 / Expanded workspace and PC access

- Brought the expanded job, customer/site, schedule and inspection layout into the blank company edition.

- Added PC installation guidance and the hosted browser workspace, with local saved-record and resume checks.

- Improved offline dependencies and update handling while keeping company branding and saved records.

Build 5 / Restore from Drive backups

- Added a list of the account's recent app backups and restore into an empty local workspace.

- Backup restore validates the company, account and file format and prevents replacement of an existing populated workspace.

Build 4 / Automatic backup improvements

- Added hourly Drive backup while the app is open and connected.

- Improved silent authorization refresh, with a reconnect prompt when Google consent is required, and added a visible development-build label.

Build 3 / Subscription feedback and recovery

- Added visible subscription loading, retry and error states.

- Bounded Google Play price and restore queries so an unanswered request does not leave the controls waiting indefinitely.

Build 2 / Company membership

- Enabled Google account company registration and owner membership through the separate company-access service.

- Added authenticated company-access checks and company isolation for the Android app.

Build 1 / Independent company edition

- Created a blank InspectPro company workspace with editable company information and logo, neutral reports and its own Android identity.

- Added local record storage, separated company/account workspaces, Google sign-in and optional backups in the user's own Drive.
